

HOME-BASED CARE FROM THE LEADERS IN NEUROREHABILITATION

Following a brain injury, the path toward independence is unique for every individual. The best type of care is dependent upon several factors specific to each individual situation and stage of recovery. When considering rehabilitation options, patients, care providers, and payer groups should match the patient with the right form of rehabilitation at the right time and in the right place.

At Learning Services, we have been providing industry-leading residential rehabilitation services for adults with neurological injuries for more than 30 years. In an effort to cater to individual patients' specific rehabilitation needs, we now provide comprehensive home-and-community-based rehabilitation services.

Some patients will benefit from either residential or home-based rehabilitation, while others will require both types of care during different periods of recovery. By adding to the Learning Services' continuum of care, this service line enables patients to start in a residential facility and later transition to home and community rehabilitation when necessary.

HOME & COMMUNITY NEUROREHABILITATION PROGRAM

MAKE A REFERRAL

It's never too early to contact Learning Services. Early intervention directly correlates with cost savings and better outcomes. Our clinical experts can assist in determining the appropriate services for each individual. And we work with a wide range of payers, including workers' compensation, private health plans, auto and liability, liens, military, and private pay.

If you are working with a person with a neurological injury that you believe could benefit from our services, please contact us to discuss program options.

FUNCTIONAL REHABILITATION AT HOME

Along the path to recovery, one of the primary goals of rehabilitation is for patients to perform necessary household tasks safely and independently. Home- and community based patients can learn functional skills within the comfort of their own living environments, providing the best preparation possible for increased independence. With a primary focus on improving functionality, our home- and community-based rehabilitation programs are uniquely positioned to maximize independence within a short amount of time.

COMPREHENSIVE, COORDINATED CARE

Our experience and expertise from more than 30 years of rehabilitation and recovery treatment translates seamlessly to the home-and-community-based program. Program Participants receive comprehensive, interdisciplinary rehabilitation from a full team of neuro specialists, all working toward common functional goals. And each patient is assigned a case manager to streamline information and to provide a single point of contact.

INTEGRATION IN THE COMMUNITY

Increased independence requires more than an ability to navigate one's own home. Our program extends beyond the home and into the community where patients learn to safely perform essential functions. Our neuro experts work with patients at grocery stores, gyms, and work sites to ensure that they can safely perform all the tasks associated with day-to-day living post rehabilitation. We also work with families and other caregivers to ensure that they have the tools necessary to assume responsibility for longer-term care.

PRODUCING DURABLE OUTCOMES

Home-and-community-based rehabilitation services give patients the opportunity to improve function within their actual living environments. As they learn the skills necessary to perform essential tasks in their homes and communities, they gain independence. Most importantly, these programs eliminate the sometimes-difficult transition time between facilities or outpatient settings and a patient's home, resulting in more durable and beneficial outcomes for patients and payer groups.
